PRIORITY APPLN. INFO.:			US 2007-898700P	P 20070201
ED	Entered STN: 08 Aug 2008			
AB	<p>The invention relates to a process for coating a solid, water-insol. particulate matter, with a metal oxide comprising: (a) contacting the solid, water-insol. particulate matter with an ionic additive and an aqueous medium to obtain a dispersion of said particulate matter having pos. charges on its surface; (b) subjecting the particulate matter to a coating procedure comprising precipitating a metal oxide salt onto the surface of the particulate matter to form a metal oxide layer thereon to thereby obtain particulate matter coated by a metal oxide coating layer; (c) repeating step (b) at least 4 more times; and (d) aging said coating layer. The invention further relates to particles comprising a particulate matter coated by a metal oxide layer, to a use of the particles for topical administration, and to a method for preventing, reducing, or eliminating pests at a locus, using the particles.</p>

AB Cropping systems for managing weeds comprise, in one embodiment, sowing transgenic plants that display tolerance to an auxin-like herbicide such as dicamba and applying at least a first herbicide treatment to the growing environment to control weed growth. The system may further comprise applying ≥2-5 of said herbicide treatments. Methods for minimizing the development of herbicide-resistant weeds are also provided.

AB	Granular herbicidal compns. comprising mesotrione impregnated into or coated on the surface of a granular substrate material, such as a fertilizer granule and/or a solid inert carrier, control weeds in turfgrasses without causing damage to the grass. Thus, 0.61% Callisto (a 40% mesotrione formulation) was mixed with granular fertilizer in a rotating drum until the mesotrione was uniformly coated on and absorbed into the fertilizer granules. When the composition was applied at 0.33 lb/acre, with evaluation after 14 and 26 days, results showed that the composition is safe for the turfgrasses tested (perennial ryegrass, fine fescue, and tall fescue) and effective in causing initial injury and long-term control of dandelion, white clover, and crabgrass.

ED Entered STN: 26 Dec 2003

AB A novel herbicidal composition comprising a metal chelate of a 2-(substituted benzoyl)-1,3-cyclohexanedione (Markush given) and an organic phosphate, phosphonate, or phosphinate adjuvant shows improved activity with little or no increase in crop damage. Thus, mesotrione copper salt + 0.5% tri-Bu phosphate sprayed at 320 g/ha gave 97% control of Echinochloa crus-galli with no damage to two maize varieties.

ED Entered STN: 16 Nov 2001

AB The invention relates to the combination of a herbicide from the group of the sulfonylureas, with a polymer, while forming hydrogen bridges, for the controlled release of the active substance. The polymer and the active substance have functional groups that facilitate the formation of hydrogen bridges. The preferred polymers are poly(vinyl alc.) or partially-saponified poly(vinyl acetate).

AB Compns. are described, containing: (a) pesticides or phytohormones, and (b) alkyl or alkylaryl phosphoric acid ester adjuvants, the esters comprising ≥ 1 branched alkyl groups. The phosphoric acid esters are I ($\text{R}^1 = \text{C}_6\text{-30}$ alkyl or alkenyl or alkylphenyl; $\text{R}^2, \text{R}^3 = \text{H}$, alkali metal, alkaline-earth metal, etc.; $\text{A}1, \text{A}2, \text{A}3 = \text{alkylene}$; $x, y, z = 10, 1\text{-}30$). The adjuvants enhance the activity of the active ingredient.
